Carrier Screening ACT Sheet
Sickle Cell Carrier/Trait

**Carrier Screening:** Carriers are primarily identified through population screening programs.

**Condition Description:** Carriers are heterozygous for the sickle cell (Hb S) mutation and are usually asymptomatic.

---

**YOU SHOULD TAKE THE FOLLOWING ACTIONS:**

- Confirm screening result by hemoglobin separation by electrophoresis, isoelectric focusing or high performance liquid chromatography (HPLC). DNA studies may be used to confirm the genotype.
- Inform individual of carrier screening result. Provide counseling and education.
- Consult with a genetic counselor or geneticist for additional testing recommendations for the reproductive partner.
- Perform urinalysis annually. Ask about gross hematuria at every visit.

---

**Clinical Considerations:** Carriers do not have anemia. For the large majority of carriers, no restrictions of physical activity are indicated. In hypoxic conditions (strenuous exercise, dehydration, high altitude), sickling may occur. Rarely, this may lead to splenic infarction, hematuria secondary to renal papillary necrosis, or exertional heat illness (rhabdomyolysis, heat stroke, or renal failure). High-performance athletes should be made aware of nonspecific early warning signs of heat related illness.

Sickle cell trait has also been reported in association with renal medullary carcinoma in young people (ages 11 to 39 years) and early onset of end stage renal disease in patients with autosomal dominant polycystic kidney disease.

**Reproductive Implications:** When an individual is found to be a carrier of the sickle cell mutation, the reproductive partner should be offered carrier screening for mutations in the same gene. If both parents are carriers of the sickle cell mutation (i.e. have sickle cell trait), or if one parent has sickle cell (Hb S) trait and the other parent is a carrier of another sickling mutation (e.g. Hb C trait, beta thalassemia trait or another type of trait), there is a 1 in 4, or 25%, chance in each pregnancy that the offspring will have sickle cell disease.

Disclaimer: This guideline is designed primarily as an educational resource for clinicians to help them provide quality medical care. It should not be considered inclusive of all proper procedures and tests or exclusive of other procedures and tests that are reasonably directed to obtaining the same results. Adherence to this guideline does not necessarily ensure a successful medical outcome. In determining the propriety of any specific procedure or test, the clinician should apply his or her own professional judgment to the specific clinical circumstances presented by the individual patient or specimen. Clinicians are encouraged to document the reasons for the use of a particular procedure or test, whether or not it is in conformance with this guideline. Clinicians also are advised to take notice of the date this guideline was adopted, and to consider other medical and scientific information that become available after that date.
